

Python data structure - list

To find out how many items in a list, use the len function

```
myList = ['tic', 'tac', 'toe']  
len(myList)
```

Python data structure - list exercise

- Use random module
- create two lists - one contain a list of **nouns** and the other, **adjectives**
- Get one random item from the **adjectives** and the other random item from the **nouns** list, combine those two items to make non-sense words.

Skills needed:

1. create **lists**
2. understand list **index**
3. use **random** module to generate random integers between a range
4. use the **len** function to work out the maximum index for a list
5. **print** function
